CORRIGENDUM

The paper by L. Rivosecchi, K.R.S. Ascher and E. Mosna under the title "Studies on insecticide resistant Anopheles. VI. Sex of larvae and chromosome arrangement in A. atroparvus" should be corrected as follows:

Page 3, last sentence should read: We were unable to apply successfully this method in third and fourth stage larvae of A. atroparvus, though we did not use freshly moulted fourth instars, i.e. larvae with unpigmented head-capsules.

Page 11, the first paragraph should read: Only few recent data are available on the sex ratio in the Sens. Roma strain (Table 5). The RAFM strain (selected with DDT in both sexes of the adult stage), followed up through more than 20 generations (Table 6) had less than 50% females. The same was found to be true for two generations of a strain RAF (selection with DDT of adult females only), which was discarded after the second generation (Table 5).

Page 13, Table 7, under row F26 the second date should read 30 September 1957.
